

ABSTRACT OF THE DISCLOSURE

In an image data administration system, a customer can upload a plurality of image data with attached information such as a date and a keyword from his terminal equipment such as a personal computer to an image data administration apparatus. When the customer wished to survey or to print an index images in which a plurality of images having a specific information are arranged, he transmits a specific information to the image data administration apparatus. The image data administration apparatus selects the image data having the same specific information and forms an index image data using the selected image data and transmits the index image data to the terminal equipment of the customer or a photographic printer at a photo shop. Thus, the customer can survey or obtain the index image.
